

Gebruiks- en montagevoorschrift
"PIR aanwezigheidsdetector"
PLF-IB-PIR Generatie 2 870550
PLF-IB-PIRS10 10m Kabel 870555

Specificaties:

Aansluitspanning	: 220 - 240Vac 50Hz
Relaisuitgang 1	: L' nuldoorgang gestuurd
Uitgangsspanning	: 220 - 240Vac [doorgeschakelde fase]
Schakelvermogen	: 2000W, 10A cos phi 1.0
Halogeenlampen	: 1000VA - [600W elektronisch]
Fluorescentielamp	: 900VA - 100μF
Dulux lampen	: 1000W - 100μF
Spaarlampen	: 600VA / 400W
Led lampen	: 400W
Evsu / drivers	: max: 25 stuks
Luxwaarde inst.	: 10 Lux - daglichtniveau
Luxwaarde inst.	: 10 - 2000Lux [inlerend]
Tijdstelling	: 5 sec - 30 min, Puls
LED-indicatie	: Ingebouwde rode LED

Relaisuitgang 2	: D1 + D2
Uitgang	: potentiaalvrij contact
Schakelvermogen	: 5A cos phi 1.0
Luxwaarde inst.	: geen, [schakelt ook bij daglichtniveau]
Tijdstelling	: 10 sec - 60 min

Detectiehoek	: 360°
- veld Ø	: 2 voudig, 4 meter aanwezigheid en 7 meter beweging [zie Fig.2]
- bereik	: 40m² instelbaar [vloerniveau bij een montagehoogte van 2,5m]

Gevoeligheid	: instelbaar
Lensmasker	: multi-gesegmenteerd
Afstandbediening	: uitgebreid IR-10 870588.
Extra ingang	: gebruiker IR-02 870590
Boorgat sensor	: triggerbaar via remote ingang
Plefdpaneel dikte	: 5 - 25 mm
Afmetingen	: [zie Fig.1]
Bescherming sensor	: IP44 klasse II
Powerblok	: IP20
Temperatuur	: 0°C tot +45°C
Prod.normen	: CE / TÜV
Lengte sensor slave	: 870555 10meter kabel
Sensor adapter	: van 1 naar 2 ingangen 870589 adapter RJ12

Montagevoorschrijf	Let op: maak voor de montage alle aansluitkabels spanningsvrij en lees de gebruiksaanwijzing goed door. Raadpleeg bij twijfel een erkend installateur!!!
Bepalen van de juiste positie	

De ideale montage hoogte is 2,5 meter [zie Fig.2]. Indien de sensor hoger hangt wordt de detectiegevoeligheid minder. Bepaal de plaats waar de detector in of tegen het plafond moet worden geplaatst en houd rekening met het volgende:
1.Luchtkanalen: let op uitstoot van wasemkappen, verwarmingsroosters, wasdrogers enz. [zie Fig.3]
2.Objecten die door luchtstromen kunnen bewegen zoals planten en gordijnen [zie Fig.3]
3.Richt de sensor niet op andere lichtbronnen
4.Richt de sensor niet op sterk reflecterende oppervlaktes zoals zwembaden [i.v.m. snelle temperatuurschommelingen]
5.houd rekening met eventuele loop richtingen. [probeer altijd het veld zodanig te plaatsen dat de looprichting het veld kruist i.p.v. rechtstandig de sensor benadert.
6.monter de detector niet op geleidende oppervlakten

Installatie.	Montage in verlaagd plafond.
1.boor een gat van 65mm in het plafond [zie Fig.5]	
2.open het schakelblok en sluit de bekabeling aan volgens het gewenste bedradingsschema [zie Fig.4, a,b,c]	
3.indien nodig verwijder de uitbreepoorten om dikkere kabels in	

Garantie:	24 maanden mits de aanwezigheidsdetector volgens voorschrift is toegepast en niet is geopend.

Instructions for use and mounting "PIR motion detector"

PLF-IB-PIR Generation 2 **870550**
PLF-IB-PIRS10 10m Cable **870555**

Specifications:

Connection current:	: 220 - 240Vac 50Hz
Relay output 1	: L' zero-crossing controlled
Output current	: 220 - 240VAC (switched phase)
Switching output	: 2000W, 10A cos phi 1.0
Halogen lamps	: 1000VA - [600W electronic]
Fluorescent lamps	: 900VA - 100μF
Dulux lamps	: 1000W - 100μF
Energy-efficient lamps	: 600VA / 400W
LED lamps	: 400W
Electronic ballast / drivers	: max: 25 items
Lux level setting	: 10 Lux - daylight level
Lux level setting	: 10 - 2000Lux [read in]
Time setting	: 5 sec - 30 min, Pulse
LED-indication	: Built-in red LED
Relay output 2:	: D1 + D2
Output	: potential-free contact
Switching output	: 5A cos phi 1.0
Lux level setting	: none, [switches in daylight level too]
Time setting	: 10 sec - 60 min
Detection angle	: 360°
- field Ø	: dual, 4 meter presence and 7 metre movement [see Fig.2]
- range	: 40m adjustable [floor level at installation height of 2.5m]
Sensitivity	: adjustable
Lens mask	: multi-segmented
Remote control	: expanded IR-0 870588, user IR-02 870590.
Extra input	: triggered via remote input
Drill-hole sensor	: 65 mm
Ceiling panel thickness	: 5 - 25 mm
Dimensions	: (see Fig.1)
Protection sensor	: IP44 category II
Power block	: IP20
Temperature	: 0°C to +45°C
Prod. norms	: CE / TÜV
Length of sensor cable	: 870555 10 metre cable
Sensor adapter	: from 1 to 2 inputs 870589 adapter RJ12
General	

This PLF-IB-PIR motion detector is an "all-round" for switching and controlling lighting in offices, halls, warehouses, schools, conference rooms, corridors, etc. This detector has 1 relay output with a switched phase, with a zero-crossing controller that is resistant to high inrush current. A 2nd relay which independently switches of lux is potential-free so that this can be connected to other sensors or external HVAC systems. The detector can also be operated via an IR remote control or manually via a pulse switch on the remote input. The detection area is a circle with a diameter of 7 metres. The inner core of this area is most sensitive and the outer edge has lower level of sensitivity (more substantial movements required). The sensor is fully adjustable in time, sensitivity and lux value threshold. This lux value can be read-in between 10 and 2000 Lux. The user can thus choose any level. Sensitivity is automatically adjusted. Once the initial detection has taken place, the detector will increase its detection sensitivity to the maximum level. After switching off, sensitivity will once again reduce to a lower level. This PIR also has an extra RJ12 Slave input in order to connect external slave detectors so that the detection area can be expanded to include 5 additional detectors. A floor space of 240m² can thus be covered. Remote control 870590 can be used to switch the sensor constantly on or off for a 8 hour period. The sensor is equipped with a red LED behind the lens which allows the installer to set the detection field and obtain feedback when amending the various settings. The detector is fitted with a quick-installation system that is reflected in the short installation time required. The set encompasses a self-adjusting tension-capture system for wiring and/or cabling. RJ connectors for click-and-go installation as well as extra zero anphase connectors so that all connections can be made within the switch block. The lens mask supplied enables the detection field to be masked so that unnecessary switching is ruled out. The detector can operate almost all types of lighting, including high-frequency fluorescent lighting (900VA) LED lighting and halogen lighting in low and high voltage.

Installation instructions

NB: disconnect all cables and ensure they are free of current and read instructions thoroughly before installation. If in doubt, consult a qualified installer!!!

Determine the correct position

The ideal installation height is 2.5 metres [see Fig.2]. If the sensor hangs higher than this, detection sensitivity will be reduced. Determine the location at which the detector must be installed in or on the ceiling and bear the following in mind:
1. Air vents: be aware of emissions from extractor hoods, heaters, grilles, tumble-dryers and so on [see Fig.3]
2. Objects that could move as a result of air flows and curtains [see Fig.3]
3. Do not aim the sensor at other light sources
4. Do not aim the sensor at very reflective surfaces such as swimming pools [in relation to rapid temperature fluctuations]
5. be aware of any walking flows and their directions. [always try to locate the field so that the walking direction crosses the field instead of approaching the sensor in a perpendicular manner].
6. do not install the detector on conductive surfaces

Installation

Installation in a lowered ceiling.

1. drill a hole of 65mm in the ceiling [see Fig.5]
2. open the switch block and connect the cabling according to the desired wiring scheme [see Fig.4, a,b,c]

3. if necessary, remove the breakable access points to use thicker cables [see Fig.6].
4. connect the sensor(s) to the switch block via the RJ-12 connector [see Fig.4, a,b,c]
5. connect the cover caps and secure the primary side with a screw and place the switch block through the hole in the ceiling.
6. hold the 2 springs pushed upwards [see Fig.5]
7. push the entire unit into the hole in the ceiling
8. slowly release the springs so that the detector pulls itself into the hole.

9. test and adjust the detection field, set all functions and close the operating panel.
NB. Output: 'L', D1 and D2 may be bridged in parallel via a manually operated switch, as long as the same phase [supply] is used [see Fig.4, a,b,c].
Before the switch block is put into the hole and installed on the ceiling, check that all of the connections are correct and that the cover caps, necessary for taking up any tension, have been installed properly. Place the detector in the drilled hole by directing the long clamping springs upwards. Now insert the sensor until it secures itself.

Setting up and functionality.
After a final check, the power can be switched on. Once the power has been switched on, the sensor needs around 3 min. to come up to operational temperature! Use the lens mask to adjust the detection field. The lens mask is made up of 2 rings, each with 12 elements, each of which masks 30° [see Fig.8]. Every element masks 1.5 m of the detection field. Remove all elements from the lens mask that are not required and secure the lens mask to the recesses on the sensor [see Fig.9]. Open the operating panel with a small screwdriver to adjust settings:

1. Setting the detection angle:
- field Ø : 360°
- range : 40m adjustable [floor level at installation height of 2.5m]
2. Setting the sensitivity:
- lens mask : adjustable
- remote control : expanded IR-0 870588, user IR-02 870590.

3. Setting the time delay:
- extra input : triggered via remote input
- drill-hole sensor : 65 mm
- ceiling panel thickness : 5 - 25 mm
- dimensions : (see Fig.1)
- protection sensor : IP44 category II
- power block : IP20
- temperature : 0°C to +45°C
- prod. norms : CE / TÜV

4. Setting the detection angle:
- field Ø : 2-fach, 4 Meter Anwesenheit und 7 Meter Bewegung [siehe Abb.2]
- Bereich : 40m! Einstellbar [Bodenhöhe bei einer Montage- höhe von 2.5m]
5. Setting the sensitivity:
- Lensmaske : mehrfach segmentiert
- Fernbedienung : erweitert IR-10 870588, Nutzer IR-02 870590
6. Setting the time delay:
- Zusätzlicher Eingang : triggerbar über Remote-Eingang
- Bohrlochsensor : 65 mm
- Deckenplattendicke : 5 - 25 mm
- Abmessungen : (siehe Abb.1)
- Schaltern : IP20
- Temperatur : 0°C bis +45°C
- Prod. Standards : CE / TÜV

7. Setting the detection angle:
- Längensensor Slave : 870555 10 Meter Kabel
- Sensor-Adapter : von 1 auf 2 Eingänge 870589 Adapter RJ12

Allgemeines
The PIR-IB-PIR is equipped with an automatic, intelligent sensitivity setting. This means that a regular sensitivity level is set before the detector switches on. After initial detection, sensitivity is increased so that the sensor can effectively detect small movements. This function ensures that there is no unnecessary switching and that a user in the detection field is detected effectively. This function is fully automated and cannot be altered by the user. The user can, however, determine the range and overall sensitivity of the system using the metre button.

8. Setting the detection angle:
- Remote (R) clamp on the connection block. Remote means that the user can use a pulse switch(es) to operate detector output 1 with a short, remote pulse.
9. Manually switching to 'off' setting.
If the detector has switched on lighting from relay 1, the user can give a short 'pulse < 1 sec' on the connected pulse switch in order to switch off this relay. The lighting will then stay off until further motion is detected, including run-off time. If the run-off time runs out and there has been no detection, the detector will return to regular, automatic functioning.

10. Manually switching to 'on' setting.
If the user would like to switch the lighting on in the meantime, he simply has to give another short pulse. The lighting will then go on and the detector will keep the relay activated as long as there is detection. Once there is no further detection, and the run-off time has passed, the lighting will go off and the detector will reset itself to automatic functioning.

Installation instructions
NB: disconnect all cables and ensure they are free of current and read instructions thoroughly before installation. If in doubt, consult a qualified installer!!!

Optional:

Slave sensor art. no. 870555 PLF-IB-PIR/S

To expand the detection area, the switch block can accommodate an extra slave sensor so that these can operate one switch block together. A maximum of 5 slave sensors can be connected to one switch block. The sensor adapter 870589 makes it easy to connect multiple sensors to one sensor input [see Fig.4, a,b,c]. To obtain maximum coverage, the detection fields from each sensor must overlap one another. The optional sensor is therefore supplied with a 10 metre signal cable.

11. Air vents: be aware of emissions from extractor hoods, heaters, grilles, tumble-dryers and so on [see Fig.3]

12. Objects that could move as a result of air flows and curtains [see Fig.3]

13. Do not aim the sensor at other light sources

14. Do not aim the sensor at very reflective surfaces such as swimming pools [in relation to rapid temperature fluctuations]

15. be aware of any walking flows and their directions. [always try to locate the field so that the walking direction crosses the field instead of approaching the sensor in a perpendicular manner].

16. do not install the detector on conductive surfaces

Guarantee:

24 months as long as the motion detector is used according to instructions and has not been opened.

oder über einen Pulsschalter am Remote-Eingang gesteuert werden. Der Detektionsbereich ist ein runder Kreis mit einem Durchmesser von 7 Metern. Der Innenrand dieses Gebiets ist am empfindlichsten und der Außenrand am niedrigsten Empfindlichkeitsniveau (größere Bewegungen). Zeit, Empfindlichkeit und Lux-Schwelle des Sensors können vollständig eingestellt werden. Dieser Luxwert kann auch zwischen 10 und 2000 Lux eingestellt werden. So kann der Nutzer jedes Niveau auswählen. Die Empfindlichkeit wird automatisch nachgestellt. Sobald die erste Detektion stattgefunden hat, nimmt die Detektionsempfindlichkeit des Detektors auf die maximale Höhe zu. Nach dem Ausschalten wird die Empfindlichkeit auf ein niedrigeres Niveau heruntergesetzt. Diese PIR verfügt auch über einen zusätzlichen RJ12 Slave-Eingang zum Anschließen externer Slave-Detektoren, dass der Detektionsbereich um 5 zusätzliche Detektoren erweitert werden kann. Dadurch kann eine Fläche von 240m² erfasst werden. Mit der Fernbedienung 870590 kann der Sensor vor 8 Uhr konstant ein- oder abgestellt werden. Der Sensor ist hinter der Linse mit einer LED versehen. Die LED blinkt 25 Sekunden und wenn der Luxwert zwischen 10 und 2000 Lux ist, schaltet sich anschließend die Beleuchtung ein. Dadurch wird der Wert ernsthaft gestört.

Remote control IR-10 870588, IR02 870590

Achtung! Sorgen Sie dafür, dass das Umgebungslicht nicht durch Hände oder den eigenen Körper beeinflusst wird. Dadurch wird der Wert ernsthaft gestört.

Alle Einstellungen können leicht reguliert werden. Dies geschieht über die Relais. Der End-user kann also eine ständige 8-Stunden-Intervallzeit eingestellt haben. Mit der Fernbedienung 870590 kann der Sensor vor 8 Uhr konstant eingeschaltet werden. Dadurch beginnt der Eingabeprozess. Die LED blinkt 25 Sekunden und wenn der Luxwert zwischen 10 und 2000 Lux liegt, schaltet sich die Beleuchtung ein. Dadurch wird der Wert ernsthaft gestört.

Remote control IR-10 870588, IR02 870590

Stellen Sie am Rand des Detektionsfelds entlang und kontrollieren Sie, ob der Detektor wunschgemäß funktioniert [siehe Abb. 10]. Die LED leuchtet bei Detektion auf und das Relais schaltet sich für 2 Sekunden ein. Mit der „Metertaste“ können Sie das Detektionsfeld verkleinern und empfindlicher machen. Stellen Sie anschließend den Luxwert und die Nachlauf-Schaltzeit wunschgemäß ein.

Funktionen

Luxwert eingeben.

Durch Einstellen des Potentiometers des Luxwertes auf das „Auge“ wird der aktuelle Luxwert als Schaltschwellwert eingestellt [siehe Abb. 7a].

Achtung! Sorgen Sie dafür, dass das Umgebungslicht nicht durch Hände oder den eigenen Körper beeinflusst wird. Dadurch wird der Wert ernsthaft gestört.

Sobald der Potentiometer auf das „Auge“ eingestellt wird, beginnt der Eingabeprozess. Die LED blinkt 25 Sekunden und wenn der Luxwert zwischen 10 und 2000 Lux ist, schaltet sich anschließend die Beleuchtung ein. Wenn der Luxwert außerhalb des Bereichs von 10-2000 Lux liegt, gibt der Sensor einen Wert an, indem er nach Ablauf der 25 Eingabesekunden die Beleuchtung und die LED nicht einschaltet. Die LED blinkt noch 5 Sekunden lang [siehe Abb. 7b].

Installation

Installation in a lowered ceiling.

1. drill a hole of 65mm in the ceiling [see Fig.5]

2. open the switch block and connect the cabling according to the desired wiring scheme [see Fig.4, a,b,c]

3. if necessary, remove the breakable access points to use thicker cables [see Fig.6].

4. connect the sensor(s) to the switch block via the RJ-12 connector [see Fig.4, a,b,c]

5. connect the cover caps and secure the primary side with a screw and place the switch block through the hole in the ceiling.

6. hold the 2 springs pushed upwards [see Fig.5]

7. push the entire unit into the hole in the ceiling

8. slowly release the springs so that the detector pulls itself into the hole.

9. test and adjust the detection field, set all functions and close the operating panel.

NB. Output: 'L', D1 and D2 may be bridged in parallel via a manually operated switch, as long as the same phase [supply] is used [see Fig.4, a,b,c].

Before the switch block is put into the hole and installed on the ceiling, check that all of the connections are correct and that the cover caps, necessary for taking up any tension, have been installed properly. Place the detector in the drilled hole by directing the long clamping springs upwards. Now insert the sensor until it secures itself.

Setting up and functionality.

After a final check, the power can be switched on. Once the power has been switched on, the sensor needs around 3 min. to come up to operational temperature! Use the lens mask to adjust the detection field. The lens mask is made up of 2 rings, each with 12 elements, each of which masks 30° [see Fig.8]. Every element masks 1.5 m of the detection field. Remove all elements from the lens mask that are not required and secure the lens mask to the recesses on the sensor [see Fig.9]. Open the operating panel with a small screwdriver to adjust settings:

1. Setting the detection angle:

- field Ø : 360°

- range : 40m adjustable [floor level at installation height of 2.5m]

2. Setting the sensitivity:

- lens mask : adjustable

- remote control : expanded IR-0 870588, user IR-02 870590.

3. Setting the time delay:

- extra input : triggered via remote input

- drill-hole sensor : 65 mm

- ceiling panel thickness : 5 - 25 mm

- dimensions : (see Fig.1)

- protection sensor : IP44 category II

- power block : IP20

- temperature : 0°C to +45°C

- prod. norms : CE / TÜV

4. Setting the detection angle:

- field Ø : 2-fach, 4 Meter Anwesenheit und 7 Meter Bewegung [siehe Abb.2]

- Bereich : 40m! Einstellbar [Bodenhöhe bei einer Montage- höhe von 2.5m]

5. Setting the sensitivity:

- Lensmaske : mehrfach segmentiert
